Education

| SUBJECT and GRADE | Mathematics Grade 12 |  |
| :---: | :---: | :---: |
| TERM 1 | Week 6 |  |
| TOPIC | Euclidean Geometry Pythagorean Theorem and mixed problems |  |
| AIMS OF LESSSON | - Use similarity to prove the Theorem of Pythagoras <br> - Apply knowledge to problems <br> - Answer riders using a combination of theorems |  |
| RESOURCES | Paper based resources |  |
|  | Go to this section in your textbook. |  |
| INTRODUCTION: Up to this stage you should know the following facts: |  |  |
| Theorem 1: <br> Proportionality | If | then |
|  | DE \|| BC | $\frac{\mathrm{AD}}{\mathrm{DB}}=\frac{\mathrm{AE}}{\mathrm{EC}}$ |
|  | If | then |
| Theorem 2: Similarity |  | $\frac{\mathrm{DF}}{\mathrm{AB}}=\frac{\mathrm{FE}}{\mathrm{AC}}=\frac{\mathrm{DE}}{\mathrm{BC}}$ |

## CONCEPTS AND SKILLS

We will be using the above skills to prove the following: Let's look at the following special case.

## What is special in this <br> case?

The perpendicular is drawn from the vertex of a right-angled triangle onto the hypotenuse

Let's see if these triangles are similar to each other

In $\triangle \mathrm{ABC}$ and $\triangle \mathrm{ABD}$ :
$\begin{array}{lll}\text { 1. } \mathrm{C} \widehat{\mathrm{A} B}=\mathrm{A} \widehat{\mathrm{D} B} & {\left[\text { both }=90^{\circ}\right]} \\ \text { 2. } & \widehat{\mathrm{B}}=\widehat{\mathrm{B}} & {[\text { common }]}\end{array}$
[common]
$\therefore \quad \triangle \mathrm{ABC}||\mid \triangle \mathrm{DBA} \quad[\angle, \angle, \angle]$

$$
\begin{array}{ll} 
& \therefore
\end{array} \quad \frac{\mathrm{AB}}{\mathrm{DB}}=\frac{\mathrm{BC}}{\mathrm{BA}}=\frac{\mathrm{AC}}{\mathrm{DA}}
$$

In $\triangle \mathrm{ABC}$ and $\triangle \mathrm{DAC}$ :

1. $C \widehat{A} B=A \widehat{D} C \quad\left[\right.$ both $\left.=90^{\circ}\right]$
2. $\hat{\mathrm{C}}=\hat{\mathrm{C}}$ [common]
$\therefore \triangle \mathrm{ABC}\|\| \Delta \mathrm{DAC}[\angle, \angle, \angle]$
$\therefore \quad \frac{\mathrm{AB}}{\mathrm{AD}}=\frac{\mathrm{BC}}{\mathrm{AC}}=\frac{\mathrm{AC}}{\mathrm{DC}}$
$\therefore \quad \mathrm{AC}^{2}=\mathrm{BC} . \mathrm{DC}$
$\Delta \mathrm{ABD}||\mid \mathrm{CAD}[$ Both $| | \mid \Delta \mathrm{ABC}]$
$\therefore \quad \frac{\mathrm{AB}}{\mathrm{AC}}=\frac{\mathrm{BD}}{\mathrm{AD}}=\frac{\mathrm{AD}}{\mathrm{DC}}$
$\therefore \mathrm{AD}^{2}=\mathrm{BD} . \mathrm{DC}$

Look at the patterns formed in each case.

| Using the results of the above, we can prove the Theorem of Pythagoras by using similarity. | The theorem of Pythagoras: <br> Required to prove: $\mathrm{BC}^{2}=\mathrm{AB}^{2}+\mathrm{AC}^{2}$ <br> Given: $\Delta \mathrm{ABC}$ with $\widehat{\mathrm{A}}=90^{\circ}$, and $\mathrm{AD} \perp \mathrm{BC}$ | Proof: $\begin{aligned} & \mathrm{AB}^{2}=\mathrm{BC} . \mathrm{BD} \\ & \mathrm{AC}^{2}=\mathrm{BC} . \mathrm{CD} \end{aligned}$ $\begin{aligned} & \mathrm{AB}^{2}+\mathrm{AC}^{2}=\mathrm{BC} \cdot \mathrm{BD}+\mathrm{BC} \cdot \mathrm{CD} \\ & =\mathrm{BC}(\mathrm{BD}+\mathrm{CD}) \\ & =\mathrm{BC}(\mathrm{BC}) \\ & =\mathrm{BC}^{2} \end{aligned}$ |
| :---: | :---: | :---: |
| Example 1: <br> In $\triangle \mathrm{ABC}, \mathrm{BD} \perp \mathrm{AC}$ and $\mathrm{AB} \perp \mathrm{BC}$. <br> Complete the following: <br> (a) $\Delta \mathrm{ABD}\\|\\|\Delta \ldots \ldots . \quad\\| \mid \Delta \ldots \ldots$ <br> (b) Hence complete that: $\begin{aligned} & \mathrm{AB}^{2}= \\ & \mathrm{BC}^{2}= \\ & \mathrm{BD}^{2}= \end{aligned}$ <br> (c) If $\mathrm{DC}=6 \mathrm{~cm}$ and $\mathrm{AB}=4 \mathrm{~cm}$, determine the length of AD <br> (d) Hence determine the length of BC. | Solution: <br> (a) $\Delta \mathrm{ABD}\|\|\|\Delta \mathrm{ACB} \\|\| \Delta \mathrm{BCD}$ <br> The angles must correspond. The rightangle is at the last letter in each case. This simplifies matters! <br> (b) | (c) <br> Let $\mathrm{AD}=x$ units $\begin{aligned} & \mathrm{AB}^{2}=\mathrm{AD} \cdot \mathrm{AC} \\ & 16 \mathrm{~cm}^{2}=x(x+6) \\ & 36=x^{2}+6 x \\ & x^{2}+6 x-36=0 \\ & (x+8)(x-2)=0 \\ & x=-8 \text { or } x=2 \end{aligned}$ <br> $\mathrm{AD}=2 \mathrm{~cm}$ Length cannot be negative <br> (d) $\begin{aligned} \mathrm{BC}^{2} & =\mathrm{AC}^{2}-\mathrm{AB}^{2} \\ \mathrm{BC}^{2} & =8^{2}-4^{2} \\ \mathrm{BC} & =\sqrt{48}=4 \sqrt{3} \mathrm{~cm} \end{aligned}$ |

| CAN YOU? |  |  |
| :---: | :---: | :---: |
| 1. Find $x$ and $y$. <br> Solution: $\begin{aligned} & x=4 \sqrt{5} \\ & y=8 \sqrt{5} \end{aligned}$ | 2. In the accompanying diagram, KLMN is a kite with diagonals bisecting at P . $\hat{\mathrm{L}}=\widehat{\mathrm{N}}=90^{\circ}$ <br> (a) Give a reason why $\Delta \operatorname{KLP}\\|\\| \Delta \mathrm{KML}$. <br> (b) Complete the following: $\begin{aligned} & \mathrm{KL}^{2}=\ldots \ldots \ldots . \\ & \mathrm{LM}^{2}=\ldots \ldots \ldots . . \\ & \mathrm{LP}^{2}=\ldots \ldots \ldots \ldots \end{aligned}$ <br> (c) Prove that: $\frac{\mathrm{PN}^{2}}{\mathrm{KN}^{2}}=\frac{\mathrm{MP}}{\mathrm{MK}}$ <br> (d) Prove that: $\mathrm{KL}^{2}-\mathrm{KP}^{2}=\mathrm{KP} \times \mathrm{PM}$ |  |

## Typical examination questions:

We are now going to apply ALL our knowledge on Proportionality and Similarity to the following problems.

## Example 2:

In the diagram, DE is a tangent to the circle at E and DFG is a straight line.
$\mathrm{DE}=\mathrm{EF}=\mathrm{FG}$ and $\mathrm{HF} \| \mathrm{DE}$.
It is further given that $\frac{\mathrm{DF}}{\mathrm{DE}}=y$. Let $\mathrm{D} \widehat{\mathrm{EF}}=x$.
(a) Give, with reasons, THREE other angles equal to $x$.
(b) Prove that:

(i)

$$
\frac{\mathrm{EH}}{\mathrm{HG}}=y
$$

(ii) $\quad \triangle \mathrm{DGE}\|\| \mathrm{DEF}$
(iii) $\mathrm{DE}^{2}=\mathrm{DF}$. DG
(iv) $\quad y^{2}+y=1$

## Solution:

(a)

| $\mathrm{E} \widehat{\mathrm{F} H}$ | $=x$ |  | $[$ alt. $\angle \mathrm{s} ; \mathrm{DE} \\| \mathrm{FH}]$ |
| ---: | :--- | ---: | :--- |
| $\widehat{\mathrm{G}}$ | $=x$ |  | $[$ tan chord theorem $]$ |
| $\mathrm{F} \widehat{\mathrm{EG}}$ | $=\widehat{\mathrm{G}}=x$ |  | $[\angle \mathrm{~s}$ opposite equal sides $]$ |

(b)
(i) $\frac{\mathrm{EH}}{\mathrm{HG}}=\frac{\mathrm{DF}}{\mathrm{FG}} \quad[$ line $/ / 1$ side of $\Delta]$ $=\frac{\mathrm{DF}}{\mathrm{DE}} \quad[\mathrm{FG}=\mathrm{DE} ;$ given $]$
$=y$
(ii) In $\triangle \mathrm{DGE}$ and $\triangle \mathrm{DEF}$ :

1. $\widehat{\mathrm{D}}$ is common
2. $\widehat{\mathrm{G}}=\mathrm{D} \widehat{\mathrm{E} F}=x \quad[$ from (a) above]
$\therefore \triangle \mathrm{DGE}\|\| \mathrm{DEF} \quad[\angle, \angle, \angle]$
(iii)
$\therefore \quad \frac{\mathrm{DG}}{\mathrm{DE}}=\frac{\mathrm{GE}}{\mathrm{EF}}=\frac{\mathrm{DE}}{\mathrm{DF}}$
[ $\triangle \mathrm{DGE}||\mid ~ \Delta \mathrm{DEF}$ ]
$\therefore \mathrm{DE}^{2}=\mathrm{DF} . \mathrm{DG}$
(iv)

$$
\begin{aligned}
\frac{\mathrm{DE}}{\mathrm{DF}} & =\frac{\mathrm{DG}}{\mathrm{DE}} & & {[\text { from (ii) }] } \\
\frac{1}{y} & =\frac{\mathrm{DF}+\mathrm{FG}}{\mathrm{DE}} & & {\left[\frac{\mathrm{DF}}{\mathrm{DE}}=y \quad \therefore \frac{D E}{D F}=\frac{1}{y}\right] } \\
& =\frac{\mathrm{DF}}{\mathrm{DE}}+\frac{\mathrm{FG}}{\mathrm{DE}} & & {[\mathrm{FG}=\mathrm{DE}] } \\
\therefore \frac{1}{y} & =\mathrm{y}+1 & & \\
\therefore y^{2}+y & =1 & &
\end{aligned}
$$

| ACTIVITIES/ASSESSMENT |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Mind Action Series | Platinum | Clever | Classroom Mathematics | Siyavula |  |
| Exercise: 8 <br> Page: 277 | Exercise: 5 <br> Page: 224 | $\begin{aligned} & \text { Exercise:11.5 } \\ & \text { Page: } 303 \end{aligned}$ | $\begin{aligned} & \text { Exercise: 11.4; } 11.8 \\ & \text { Page: } 298 \end{aligned}$ | $\begin{aligned} & \text { Exercise: } 8.9 \\ & \text { Page: } 351 \end{aligned}$ |  |
| CONSOLIDATION |  | - Know your theorems <br> - Use different colours to highlight the given information <br> - The proof of Pythagorean Theorem cannot be tested in the examination <br> - The circle Geometry of Grade 11 can be integrated with these theorems. |  |  |  |
